Box Elder bugs do not bite, but their piercing-sucking mouthparts can sometimes puncture skin, causing slight irritation. Their droppings make quite a mess and these pests can accumulate in great numbers in your home if left unchecked. A mattress is by far the most popular breeding grounds for bed bugs and we have enough pictures to make your skin crawl. The first image shows adult bed bugs, their poop, and their shells around the plastic part of the mattress. It is difficult and time consuming to inspect & deal with bugs and eggs inside of box springs and the edges of mattresses: An effective Encasement takes the complexity of the mattress and box spring out of play, restricting the movement of bed bugs to the smooth exterior of the encasement where they can be easily detected and dealt with. Boxelder bugs (*Boisea trivittata*) have troubled many homeowners since as early as 1935. Although they are not classified as a serious problem, they are a nuisance and can also let off a rather nasty smell when disturbed.
